

Mini-dose Glucagon: Evaluation

I have read the information above and watched the video. I understand:

	YES	NO
That very small doses of glucagon (mini-dose glucagon) can be used to treat persistent low blood glucose levels or to prevent severe hypoglycaemia		
That mini-dose glucagon doses must be prescribed by a diabetes doctor		
That an insulin syringe is used to draw up and administer mini-dose glucagon and that it is injected into the fatty layer under the skin
